

CS319

Final Report

Team 6

Section 1

Bora Yetkin - 22203661

Erdem Pülat - 22103566

Halil Avcı - 22003476

Ramiz Arda Ünal - 22202554

Tuna Göksal - 22203827

Build Instructions

Project Setup Guide

1. Backend Setup

1. **Navigate to the backend folder**

Open your terminal and run:

```
cd CS319-Term-Project/backend
```

2. **Install dependencies**

Run the following command:

```
npm install
```

3. **Set up environment variables**

- Create a file named `.env` in the backend folder.
- Add the following content to the `.env` file:

```
PORT=3000
```

```
MONGO_URI=<your-mongodb-uri>
```

```
JWT_SECRET=<your-secret-key>
```

- Replace `<your-mongodb-uri>` with your MongoDB connection string.
- Replace `<your-secret-key>` with a secure key for authentication.

4. **Run the backend server**

Use this command to start the backend server:

```
npx nodemon server.js
```

- The backend will be accessible at:

<http://localhost:3000>

2. Frontend Setup

1. **Navigate to the frontend folder**

Run the following command in your terminal:

```
cd ../frontend
```

2. **Install dependencies**

Execute this command:

```
npm install
```

3. **Run the frontend server**

Start the frontend server using:

```
npm run dev
```

- The frontend will be accessible at:

<http://localhost:5173>

3. Verify the Setup

1. Ensure that both servers (frontend and backend) are running simultaneously.

2. Open a web browser and go to:

<http://localhost:5173> to access the application.

3. Test the frontend features to verify communication with the backend.

4. Stop Servers

1. To stop the servers, press Ctrl + C in the terminal for both backend and frontend servers.

Work Allocation

Bora Yetkin:

- Configured and connected MongoDB for the database.
- Setted up React for the frontend, created the frontend structure and organized components.
- Implemented user authentication using JWT, including login and signup functionality.
- Added authorization using JWT to control access based on user roles (guide, advisor, coordinator, admin).
- Built the initial back-end structure with database configuration with Erdem Pülat.
- Added an admin dashboard for managing user settings.
- Setted up an email service system for sending notifications, such as confirmations with Halil Avcı.
- Scraped high school data from the MEB using Python and integrated the data into the tour application form to enable applicants to select schools easily during applications.

Halil Avcı:

- Built CORE (Weekly Schedules), its decision algorithms, database interactions, functionalities for simultaneous data manipulations with other data interactions, UI and frontend mechanisms, and created weeklySchedule objects. Added other pages related to weekly schedules. Developed Applications Page further.
- Setted up an email service system for sending notifications with Bora Yetkin, integrated it into actions to be sent automatically.
- Built review system, review submission page, its backend dynamics. Integrated it into Guides Page to be shown to coordinator.
- Added confirmation buttons and rejection notes.
- Enhanced school tour application page for resubmission mechanisms and user feedback.

Tuna Göksal:

- Built the backend structure for fairs. (more like separated it from events as before it was part of Events then decided to be moved into a separate structure)
- created the initial guide manager for events(it later changed) and guide management for fairs.
- added the edit details system (which also introduces the room choosing and advisor notes) for advisors including adding a mail system for it and updating the resubmit form so it supports both event types.
- updated the events page so it shows individual tours, school tours and fairs as different tables in the same page.

Erdem Pülat:

- Built the initial back-end structure for Users and Events with Bora Yetkin
- Configured the initial pages for events, and assigned events, and worked on the page actions in both front-end and back-end.
- Created the logs page and the logs viewing structure for coordinators.
- Initialized the applicant structure for events and later refined and configured the Tour Application page with Bora Yetkin.
- Deployed the website to 'Google Cloud' at [link](#)
- Built the 'check your application' page.
- Built the Add User page.
- Created the 'available hours' feature and its usage in manage-guides.
- Other than the code: Was responsible for the class diagram, and drafted the first use-case diagram draft with Bora Yetkin. And general contributions to other diagrams and deliverables.

Ramiz Arda Ünal:

- Designed and improved the general table layout used across the entire project.
- Developed the general view details modal, a key feature used throughout the project to display detailed data dynamically.
- Built the complete dashboard, creating a centralized platform for managing all project data and operations.
 - Dashboard Home: Displays an overview of all key data in the project.
 - Dashboard Guides: Provides a searchable interface to view guide information and their assigned events.
 - Added the logic to display assigned events for guides seamlessly in the dashboard.
 - Developed the School Priority Page, allowing users to assign and manage priorities for schools, with sorting logic based on these priorities.
 -

- Developed the prototype notification system.
- Coordinated backend and frontend integration for fetching completed events and assigned fairs.
- Refined event popups, table fixes, and minor UI issues across the platform.
- Created and fixed modals for displaying alternative dates and event details.
- Implemented and refactored various UI components and made significant changes to the application pages.
- Implemented user profile and dashboard features.
- Added the review and ratings display the dashboard and profile features.
- UI Design of the homepage, profiles, application page, dashboard, login and sign in pages.
